Essential BodyWorks

Homotoxicology Injections

Injectable Homeopathics: The Triple Benefit Effect!

Homotoxicology is a form of homeopathic treatment, but it integrates the principles of homeopathy with the approach of allopathic medicine. And, whereas classical homeopathy uses single remedies, homotoxicology uses combinations of remedies to treat a variety of underlying causes.

An added boon for homotoxicology is the “triple benefit effect”—which is why Essential BodyWorks recommends this form of therapy over many others—where you gain a minimum of three health benefits for the price of one.

1. First, the injected substance itself kick-starts the self-healing process of the body in a target-specific area (the area of the injection—the knees, for example)
2. Secondly, the hypodermic needle acts as a large acupuncture needle, providing additional local therapeutic effect (as if you were given acupuncture)
3. Third, by injecting into specific acupuncture points in the local area, you gain the added benefit of POSITIVE side effects (for example, a point on the knee is used to treat gastro-intestinal problems, so a treatment for your arthritic knees may also fix your gut...)

Homeopathy employs an approach referred to “like cures like.” A homeopathic treatment involves giving an **extremely low** dosage of a substance that would normally produce the same characteristic symptom of an illness in a healthy person if given in a large dose. Another way to view “like cures like” is that symptoms are part of the body's attempt to heal itself—for example, a fever can develop as a result of an immune response to an infection, and a cough may help to eliminate mucus—and medication may be given to support this self-healing response.

Essential BodyWorks specializes in Homotoxicology injections—which has a **superb success rate** for ailments like arthritic hands, knees, feet, back pain, shoulder– and neck pain, spasms, etc.

There are about 17,000 licensed practitioners in the United States that use some form of homotoxicology with their patients.
